

ROBIN MAKES LARGEST C-UAS DEAL TO DATE

With unprecedented drone activity predicted to continue in 2021, Robin Radar Systems have confirmed their largest multi-year deal yet, with C-UAS Defence System Integrator, Diehl Defence.

Diehl Defence delivers high-tech equipment to the defence and security sector. The company is a global technology leader in the fields of guided missiles, reconnaissance, C-UAS Systems and in advanced system solutions for Ground-Based Air Defence (GBAD).

Diehl Defence placed an order for an undisclosed number of the latest IRIS® systems, representing the largest counter drone radar contract in Robin's history.

The order comes at a time when drone activity is at a significant high. In 2020, record numbers of restricted drone activity were reported in the news, with the COVID-19 cited as the likely cause.

The drone threat is also an evolving one for military forces, who require increasingly smart solutions to counter hostile drones and protect high-value military assets - essential to operation. Armies, navies and air forces demand increasingly high performance from proven counter drone radars that must work seamlessly with existing air defence systems.

IRIS® is positioned as Robin's 'no-compromise' radar, with engineers challenged to design and build a product that wouldn't fall short in any key area of performance, under any circumstance.

Robin's drone detection radars apply unsurpassed micro-doppler classification techniques to check if flying objects have propellers, can detect hovering drones and pull key strengths in range, coverage and construct into one uniquely small footprint.

That makes IRIS® easy to transport, install and integrate with other air defence systems and technologies – precisely what it's built for.

Launched in November 2020, it comes to the market after three years of careful development, explicitly aimed to provide uncompromising insight in the high-pressured world of defence and security.
